Probability

Probability

- Probability is a numerical way of describing how likely something is going to happen.

Probability

- Probability is a numerical way of describing how likely something is going to happen.

Probability

- Probability is a numerical way of describing how likely something is going to happen.

50% chance for both H or T

Probability

- Probability is a numerical way of describing how likely something is going to happen.

What is the chance of both being Heads?

Probability

- Probability is a numerical way of describing how likely something is going to happen.

What is the chance of both being Heads?

$$1/4 = 0.25 \text{ or } 25\%$$

1 st	2 nd
H	H
H	T
T	H
T	T

4

Probability

What is the probability of getting an even number?

1 2 3 4 5 6

$$P(\text{even}) = 3/6 = 0.5 \text{ or } 50\%$$

Maximum and Minimum Probability

What is the probability of getting an 8?

1 2 3 4 5 6

$$P(8) = 0/6 = 0.0 \text{ or } 0\%$$

Maximum and Minimum Probability

What is the probability of getting a number between 1 and 6?

1 2 3 4 5 6

$$P(\text{between 1 and 6}) = 6/6 = 1.0 \text{ or } 100\%$$

Maximum and Minimum Probability

Probability Terms

Experiment

Repeatable Process with defined set of results

Outcome

Result of an experiment

Event

Set of one or more outcomes.

Sample Space

All possible outcomes

Sample Point

One possible outcome

Conditional Probability

Conditional Probability

A measure of the probability of an event (some particular situation occurring) given that another event has occurred.

-- Wikipedia

Why it is important?

$P(\text{Rain} | \text{Cloudy})$

$P(\text{Rain} | \text{Sunny})$

Conditional Probability

A measure of the probability of an event (some particular situation occurring) given that another event has occurred.

-- Wikipedia

Rain

Weather Condition

Conditional Probability

$$P(A \mid B) = \frac{P(A \cap B)}{P(B)}$$

$A \rightarrow$ Event whose probability we need to find
e.g. Will it rain?

$B \rightarrow$ Event that has already occurred
e.g. It's already cloudy

Conditional Probability

$$P(A \mid B) = \frac{P(A \cap B)}{P(B)}$$

$A \rightarrow$ Event whose probability we need to find
e.g. Will it rain?

$B \rightarrow$ Event that has already occurred
e.g. It's already cloudy

How it is used in Data Science and Machine Learning?

Will this customer buy this product?

Will this customer default the loan?

Will the loan of this customer be approved?

Random Variables

Algebraic Variables

$$X - 4 = 0$$

$$X = 4$$

$$y = x + 7$$

$$y = 11$$

Random Process

Know the possible outcomes but can not say with 100% confidence which one will happen every time the process is executed.

We know the possible outcomes but which one?

Outcome as a variable

$$X = \{ H, T \}$$

$$X = \{ 1, 2, 3, 4, 5, 6 \}$$

Modelling Random Variables

$Y =$ function of X such that sum of two dice is even

$P(Y \text{ is even})$

$X = \{ 1, 2, 3, 4, 5, 6 \}$

Modelling Random Variables

		Dice1 →					
← Dice2		1	2	3	4	5	6
	1	2	3	4	5	6	7
	2	3	4	5	6	7	8
	3	4	5	6	7	8	9
	4	5	6	7	8	9	10
	5	6	7	8	9	10	11
	6	7	8	9	10	11	12

$$P(2) = 1/36$$

$$P(4) = 3/36$$

$$P(6) = 5/36$$

$$P(8) = 5/36$$

$$P(10) = 3/36$$

$$P(12) = 1/36$$

$$P(Y \text{ is even}) = 18/36 = 0.5$$

Random Variable Type

- Discrete
- Continuous
